Weekly Petroleum Status Report

Data for Week Ended: July 13, 1990

See Notice Inside Back Cover

This publication is available from the Superintendent of Documents, U.S. Government Printing Office (GPO). Information about purchasing this or other Energy Information Administration (EIA) publications may be obtained from the GPO or the EIA's National Energy Information Center (NEIC). Questions on energy statistics should be directed to the NEIC by mail, telephone, or telecommunications device for the deaf (TDD). Addresses, telephone numbers, and hours appear below.

National Energy Information Center, E1-231 Energy Information Administration Forrestal Building, Room 1F-048 Washington, DC 20585 (202) 586-8800 TDD (202) 586-1181 Hours: 8:00-5:00, M-F, Eastern Time

Superintendent of Documents U.S. Government Printing Office Washington, DC 20402 (202) 783-3238

Released for Printing: July 18, 1990

This report was prepared by the Energy Information Administration, the independent statistical and analytical agency within the Department of Energy. The information contained herein should not be construed as advocating or reflecting any policy position of the Department of Energy or any other organization.

Preface

The Weekly Petroleum Status Report (WPSR) provides timely information on the petroleum supply situation in the context of historical information, selected prices, and forecasts. The WPSR is intended to provide up-to-date information to the industry, the press, planners, policymakers, consumers, analysts, and State and local governments. It is published each Thursday by the Energy Information Administration (EIA) and excerpts of the data are available electronically after 5:00 p.m. Wednesday. The data contained in this report are based on company submissions for the week ending 7 a.m. the preceding Friday. For some weeks which include holidays, publication of the WPSR is delayed by 1 day. The WPSR is not published during 1 of the last 2 weeks of the year depending upon which day of the week Christmas occurs. The following week's issue includes data for both weeks.

General information about this document may be obtained from Charles C. Heath (202) 586-6860, Director of the Petroleum Supply Division, Office of Oil and Gas, Energy Information Administration; or James M. Diehl (202) 586-5985, Chief of the Fuels Analysis Branch; or James M. Kendell (202) 586-9646, Team Leader of the Heating Fuels Analysis Team.

Specific information about the data in this report may be obtained from Larry J. Alverson (202) 586-9664.

Highlights

Refinery Activity (Million Barrels per Day)

	For	ır Weeks En	ding
	07/13/90	07/06/90	07/13/89
Crude Oil Input to Refineries	. 13.9	13.8	13.9
Refinery Capacity Utilization (Percent).	. 91.2	90.3	89.3
Motor Gasoline Production		7.2	7.3
Distillate Fuel Oil Production	. 3.0	3.0	2.8

Motor gasoline production for the 4 weeks ending July 13, 1990, was unchanged from that for the 4 weeks ending July 6, 1990, but about 2 percent below the level for the same period last year. Refinery capacity utilization was over 90 percent for the third consecutive week and averaged 91.2 percent for the 4 weeks ending July 13, 1990.

Stocks (Million Barrels)

		Week Ending]
	07/13/90	07/06/90	07/13/89
Crude Oil (Excluding SPR)	389.5	385.0	332.0
Motor Gasoline	218,1	217.1	221.2
Distillate Fuel Oil		113.8	105,6
All Other Oils	387.0	387.5	392.0
Crude Oil in SPR	586.7	586.7	572.8
Total*	1,699.1	1,690.1	1,623.6

Motor gasoline stocks increased slightly during the week ending July 13, 1990, but remain slightly below the lower limit of the average range for the last 3 years. Distillate fuel oil stocks increased by 4 percent during the week ending July 13, 1990, and were 12 percent above the level one year ago. Crude oil stocks increased during the week to the highest level since March 19, 1982.

Net Imports (Million Barrels per Day)

	Fot	ir Weeks En	ding
	07/13/90	07/06/90	07/13/89
Crude Oil	. 6,6	6.7	5.9
Petroleum Products	. 1.5	1.6	1.3
Total*	8,1	8.3	7.3

For the first 193 days of 1990, net imports of crude oil were 12 percent higher than for the same period in 1989, while net imports of petroleum products were 4 percent less.

Products Supplied (Million Barrels per Day)

For	ur Weeks End	ding
07/13/90	07/06/90	07/13/89
7.6	7.5	7.6
2.8	2.9	2.8
7.0	6.9	6.6
17.4.	17.3	17.1
	07/13/90 7.6 2.8 7.0	7.6 7.5 7.5 7.6 7.5 7.6 7.7 7.0 7.0 7.0 7.0 7.0 7.0 7.0 7.0 7.0

Motor gasoline supplied for the 4 weeks ending July 13, 1990, was slightly above that for the 4 weeks ending July 6, 1990, while distillate fuel oil supplied was down 2 percent.

Prices (Dollars per Barrel)

		Week Ending	9
	07/13/90	07/06/90	: 07/14/89
World Prices			
World Crude Oil	13,99	13.61	16.60
Spot Market Product Prices ¹			
Rotterdam Market			
98 Octane Gasoline(Leaded)	27.55	26,96	24.21
Gas Oil		18.83	19.50
Residual Fuel Oil		12.61	15.54
New York Market			
87 Octane Unleaded Reg Gasoline	. 27.72	25,83	24,89
No. 2 Heating Oil	. 22.09	20.20	20,62
Residual Fuel Oil		13.65	16.95

The average world crude oil price for the week ending July 13, 1990, increased slightly over the average for the previous week, but was 16 percent lower than a year ago. Spot gasoline prices on the New York Market were 7 percent higher than last week and 11 percent higher than last year.

Includes lease condensate.

Net Imports = Gross Imports (line 3) + Strategic Petroleum Reserve (SPR) Imports (line 4) - Exports (line 5).

Unaccounted-for Crude Oil is a balancing item. See Glossary for further explanation.

includes finished petroleum products, unfinished oils, gasoline blending components, and natural gas plant liquids.

includes an estimate of minor product stock change based on monthly data.

includes crude oil product supplied, natural gas liquids, liquefied refinery gases (LRGs), other liquids, and all finished petroleum products and light to the liquids and residual fuel oils.

Note: Due to independent rounding, individual product detail may not add to total. The percentages shown are calculated using unrounded Sources: See page 25.

^{*} included are stocks of all other oils such as aviation gasoline, kerosene, natural gas liquids and LRGs, other hydrocarbons and atochol. **

blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and blending components, naphthas, and other oils feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and and road oils feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and road oils feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and road oils feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and road oils feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and road oils, and road oi

¹ Calculated as 4-week average gross inputs divided by the latest reported monthly operable capacity. See Glossary. Percentages are calculated using unrounded numbers.

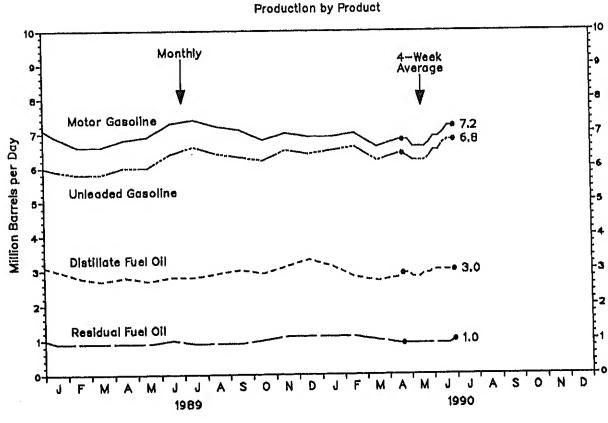

E-Estimate based on data published for the most recent month in the Petroleum Supply Monthly.

Note: Production statistics represent net production (i.e., refinery output minus refinery input).

Source: See page 25.

Figure 1. Refinery Activity (Million Barrels per Day)

¹ Product stocks include those stocks held at refineries, in pipelines, and at bulk terminals. Stocks held at natural gas processing plants are included in "Other Oils" and in totals. All stock levels are as of the end of the period.

2 Crude oil stocks include those stocks held at refineries, in pipelines, in lease tanks, and in transit to refineries, and in transit to refineries.

Petroleum Reserve.

Source: See page 25.

³ Included are stocks of all other oils such as aviation gasoline, kerosene, natural gas liquids and LRG's, other hydrocarbons and alcohol, aviation gasoline blending components, naphtha and other oils for petrochemical feedstock use, special naphthas, lube oils, waxes, coke, asphalt, road oil, and miscellaneous oils. E=Estimated. See Glossary for definition of "Stock Change (Refined Products)" for explanation of other oils estimation methodology.

Note: Data may not add to total due to independent rounding.

Figure 3. Stocks of Motor Gasoline (Million Barrels)

Average level and width of average range are based on 3 years of monthly data: January 1987 - December 1989. The seasonal pattern is based on 7 of monthly data. See Appendix for further explanation,

The National Petroleum Council (NPC) defines the Minimum Operating Inventory as the inventory level below which operating problems and shortage begin to appear in a defined distribution system. In its 1988 study, the NPC estimated this inventory level for total motor gasoline to be 205 million barrels. Se Appendix for further explanation.

of monthly data. See Appendix for further explanation.

The National Petroleum Council (NPC) defines the Minimum Operating Inventory as the inventory level below which operating problems and shortages would begin to appear in a defined distribution system. In its 1988 study, the NPC estimated this inventory level for residual fuel oil to be 30 million barrels. See Appendix for further explanation.

¹ Includes exports of crude oil and refined petroleum products. Crude oil exports are restricted to (1) crude oil derived from fields under the State waters of Alaska's Cook Inlet, (2) certain domestically produced crude oil destined for Canada, and (3) shipments to U.S. territories.

E-Estimate based on data published for the most recent month in the Petroleum Supply Monthly.

Note: Data may not add to total due to independent rounding.

Estimated contract prices based on government-selling prices, netback values, or spot market quotations. All prices are f.o.b. at the foreign port of lading except where noted; 30 day payment plan except where noted. See Appendix for procedure used for calculation of world oil prices.

An arbitrary scale expressing the gravity or density of liquid petroleum products.

Average prices (f.o.b.) weighted by estimated export volume.

On 60 days credit.

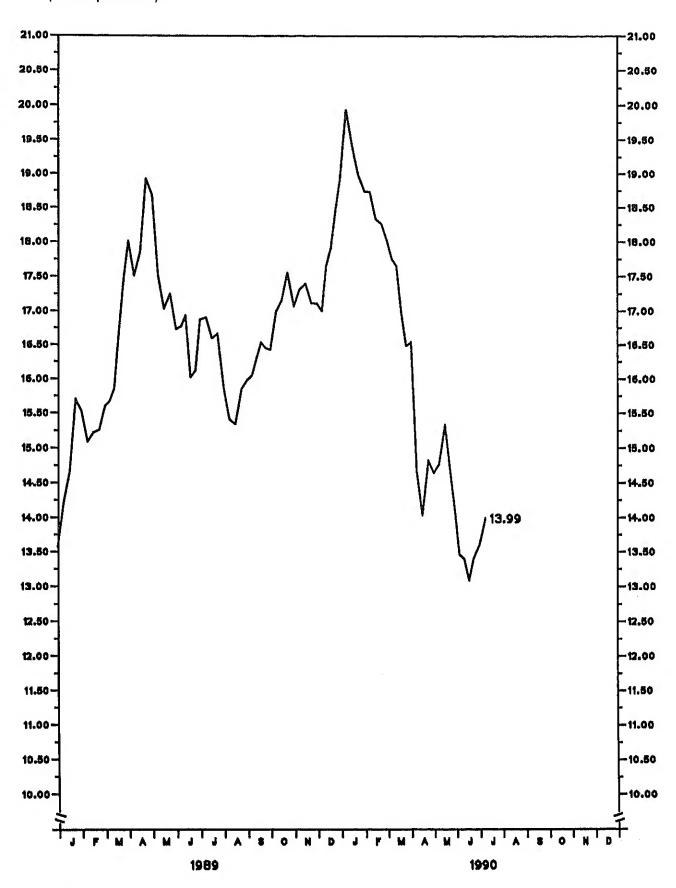

Price (CIF) to Mediterranean destinations; also called Urals.

Average prices (f.o.b.) weighted by estimated import volume.

NA=Not Applicable.

Source: See page 26.

Table 15. **Weather Summary** (Population Weighted Cooling Degree-Days1)

Weather data reported in the Weekly Petroleum Status Report are taken directly from a computerized system implemented by the National Oceanic and Atmospheric Administration, Department of Commerce. The National Oceanic and Atmospheric Administration (NOAA)/NWS, as a U.S. Government Agency, does not endorse any consumer information services.

The weather for the Nation, as measured by population-weighted cooling degree-days from January 1, 1990, through July 14, 1990, has been 1 percent warmer than last year and 10 percent warmer than normal.

Explanatory Notes

Weekly Data: Survey Design and Estimation Methods

eekly Petroleum Supply Reporting System (WPSRS) ses five surveys: the "Weekly Refinery Report" 00); the "Weekly Bulk Terminal Report" (EIA-801); the y Product Pipeline Report" (EIA-802); the "Weekly Dil Stocks Report" (EIA-803); and the "Weekly Imports (EIA-804). The EIA weekly reporting system, as part of coleum Supply Reporting System, was designed to collect nilar to those collected monthly. In the WPSRS, selected im companies report weekly data to EIA on crude oil and im product stocks, refinery inputs and production, and il and petroleum product imports. On the Forms EIA-800 EIA-803, companies report data on a custody basis. On m EIA-804, the importer of record reports each shipment 3 the United States. Current weekly data and the most monthly data are used to estimate the published weekly

le Frame

aple of companies that report weekly in the WPSRS was I from the universe of companies that report monthly. All 1 companies report data only for facilities in the 50 States 3 District of Columbia. The EIA-800 sample frame 3 all petroleum refineries in the United States and its es, industrial facilities that have crude oil distillation , and produce some refined petroleum products, and bulk Is that blend motor gasoline. The EIA-801 sample frame all bulk terminal facilities in the United States and its es that have total bulk storage capacity of 50,000 barrels , or that receive petroleum products by tanker, barge, or . The EIA-802 sample frame includes all petroleum pipeline companies in the United States and its territories nsport refined petroleum products, including interstate, e, and intracompany pipeline movements. Pipeline ies that transport only natural gas liquids are not included BIA-802 frame. Only those pipeline companies which t products covered in the weekly survey are included. A-803 sample frame consists of all companies which store 1,000 barrels or more of crude oil. Included are ig and trunk pipeline companies (including interstate, e and intracompany pipelines), crude oil producers, I operators, storers of crude oil, and companies rting Alaskan crude oil by water. The EIA-804 sample acludes all importers of record of crude oil and petroleum s into the United States.

illng

apling procedure used for the weekly system is the cut-off. In the cut-off method, companies are ranked from to smallest on the basis of the quantities reported during revious period. Companies are chosen for the sample

beginning with the largest and adding companies until the total sample covers about 90 percent of the total for each item and each geographic region for which weekly data are published.

	Weekly Form	Monthly Frame Size	Weekly Sample Size
Refiners (Refineries)	EIA-800	168(250)	59(151)
Bulk Terminals	EIA-801	331	79
Product Pipelines	EIA-802	81	44
Crude Oil Stock Holders	EIA-803	162	77
Importers	EIA-804	851	97

Collection Methods

Data are collected by mail, mailgram, telephone, Telex, and Telefax on a weekly basis. All canvassed firms must file by 5:00 p.m. on the Monday following the close of the report week, 7 a.m. Friday. During the processing week, company corrections of the prior week's data are also entered.

Estimation and imputation

After the company reports have been checked and entered into the weekly data base, explicit imputation is done for companies which have not yet responded. The imputed values are exponentially smoothed means of recent weekly reported values for this specific company. The imputed values are treated like reported values in the estimation procedure, which calculates ratio estimates of the weekly totals. First, the current week's data for a given product reported by companies in a geographic region are summed. (Call this weekly sum, W₈.) Next, the most recent month's data for the product reported by those same companies are summed. (Call this monthly sum, M₈.) Finally, let M_t be the sum of most recent month's data for the product as reported by all companies. Then, the current week's ratio estimate for that product for all companies, W_t, is given by:

$$W_l = \frac{M_l}{M_B} \cdot W_B$$

This procedure is used directly to estimate total weekly inputs to refineries and production. To estimate stocks of finished products, the preceding procedure is followed separately for refineries, bulk terminals, and pipelines. Total estimates are formed by summing over establishment types.

Weekly imports data are highly variable on a company-by-company basis or a week-by-week basis. Therefore, an exponentially smoothed ratio has been developed. The estimate of total weekly imports is the product of the smoothed ratio and the sum of the weekly reported values and imputed values.

Response Rates

The response rate as of the day after the filing deadline is about 80 percent for the EIA-800, 75 percent for the EIA-801, 95 percent for the EIA-802, 80 percent for the EIA-803, and greater than 95 percent for the EIA-804. However, more forms are received the next day, bringing the final response rates up. Late respondents are contacted by telephone. Nearly all of the major companies report on time. The nonresponse rate for the published estimates is usually between 1 percent and 2 percent.

Estimation of Domestic Crude Oil Production

Data on crude oil production for States are reported to the Department of Energy by State conservation agencies. Data on the volume of crude oil produced on Federally-owned offshore leases are reported by the Minerals Management Service, U.S. Department of the Interior. There is a time lag of approximately 4 months between the end of the reporting month and the time when the monthly crude oil production information becomes available. In order to present more timely crude oil production values, the Energy Information Administration prepares monthly crude oil production forecasts which are based on historical production patterns and are summed to obtain the weekly and 4-week crude oil production values shown in this publication. Cumulative crude oil production values shown in the U.S. Petroleum Balance Sheet include revised estimates published in the *Petroleum Supply Monthly*.

Data Assessment

The principal objective of the Petroleum Supply Reporting System is to provide an accurate picture of petroleum industry activities and of the availability of petroleum products nationwide from primary distribution channels. The weekly data, which are based on sample estimates stemming largely from preliminary company data, serve as leading indicators of the monthly data. The weekly data are not expected to have the same level of accuracy as the preliminary monthly data when compared with final monthly data. However, the weekly data are expected to exhibit like trends and product flows characteristic of the preliminary and final monthly data.

To assess the accuracy of weekly statistics, monthly estimates derived from weekly estimates are compared with the final monthly aggregates published in the Petroleum Supply Annual. Although final monthly data are still subject to error, they have been thoroughly reviewed and edited, they reflect all revisions made during the year and they are considered to be the most accurate data available. The mean absolute percent error provides a measure of the average revisions relative to the aggregates being measured for a variable. The mean absolute percent error for 1988 weekly data was less than 3 percent for 19 of the 30 major petroleum variables analyzed. Most of the variables with mean absolute percent errors of 3 percent or more were for refined products imports series. The mean absolute percent error for total weekly refined products imports was 15 percent for 1988. It should be noted that products imports data are highly variable and cannot be estimated from a sample with the same precision as other petroleum variables. Weekly estimates for refined products imports are almost always low because small companies, which are not in the weekly sample, generally import large volumes of finished products only a few times during the year.

An analytical article, "Timeliness and Accuracy of Petroleum Supply Data," which assesses the differences between interim and final data on the 30 major petroleum variables, is published in the *Petroleum Supply Monthly* once each year.

Interpretation and Derivation of Average Inventory Levels

The national inventory (stocks) graphs for total petroleum products, crude oil, motor gasoline, distillate fuel oil, and residual fuel oil in this publication include features to assist in comparing current inventory levels with past inventory levels and with judgments of critical levels. Methods used in developing the average inventory levels and minimum operating levels are describe below.

Average Inventory Levels

The charts displaying inventory levels of crude oil and petroleum products (p.7), crude oil (p.7), motor gasoline (p.9), distillate fuel oil (p.11), and residual fuel oil (p.13) provide the reader with actual inventory data compared to an "average range" for the most recent 3-year period running from January through December or from July through June. The ranges also reflect seasonal variation for the past 7 years.

The seasonal factors, which determine the shape of the upper and lower curves, are estimated with a seasonal adjustment technique developed at the Bureau of Census (Census X-11). The seasonal factors are assumed to be stable (i.e., unchanging from year to year) and additive (i.e., the series is deseasonalized by subtracting the seasonal factor for the appropriate month from the reported inventory levels). The intent of deseasonalization is to remove only annual variation from the data. Thus, deseasonalized series would contain the same trends, cyclical components, and irregularities as the original data. The seasonal factors are updated annually in October, using the 7 most recent years' final monthly data.

The seasonal factors are used to deseasonalize data from the most recent 3-year period (January-December or July-June). The average of the deseasonalized 36-month series determines the midpoint of the "average range." The standard deviation of the deseasonalized 36 months is then calculated after adjusting for extreme data points. The upper curve of the "average range" is defined as the average plus the seasonal factors plus the standard deviation. The lower curve is defined as the average plus the seasonal factors minus the standard deviation. Thus, the width of the "average range" is twice the standard deviation. The ranges are updated every 6 months in April and October (Table A1).

Minimum Operating Inventories

The lines labeled "Minimum Operating Inventory" (MOI) on the stocks graphs for crude oil, motor gasoline, distillate fuel oil, and residual fuel oil represent estimates of those inventory levels made by the National Petroleum Council (NPC) and published in April 1989 in a report of the NPC's Committee on Petroleum Storage & Transportation. The NPC defines the MOI as the inventory level below which operating problems and shortages would begin to appear in a defined distribution system. The NPC report presents the findings of a study which was directed by the NPC Committee. MOI estimates presented in the report were developed by consensus through a decision-making process that relied on the judgement of Committee members based on their operating experience, on historical inventory trends, and on the results of an NPC survey of companies that provide primary inventory data to the Energy Information Administration. The estimated MOI values are: Crude oil -- 300 million barrels; motor gasoline -- 205 million barrels; distillate fuel oil -- 85 million barrels; and residual fuel oil -- 30 million barrels.

The NPC did not develop a minimum operating inventory level for total petroleum stocks. The line labeled "observed minimum" on the "Stocks of Crude Oil and Petroleum Products, U.S. Total" graph is the lowest inventory level observed during the most recent 36-month period as published in the *Petroleum Supply Monthly*.

Projections from the Short-Term Energy Outlook, April 1990

One of the most uncertain factors affecting the domestic short-term energy outlook is the world oil price, defined here as the nominal price of imported crude oil delivered to U.S. refiners. Because of this uncertainty, three different world oil price scenarios are employed. These scenarios are used to develop a base case projection and alternative projections for domestic supply and demand.

Base Case

In the base oil price scenario, the world oil price decreases from about \$19.70 per barrel in the first quarter of 1990 to \$18.00 in the second quarter (even lower prices occurred in April), and then increases to \$19.00 in the third quarter and to \$20.00 in the fourth quarter. In 1991, the price remains at \$20.00 in the first quarter, decreases to \$19.00 in the second and third quarters, and then returns to \$20.00 in the fourth quarter. This scenario is based on the assumption that the OPEC member countries will significantly reduce their oil production in the second and third quarters of 1990 and will continue to show more production restraint for the remainder of the forecast period. In addition, it is assumed that oil refiners will be willing to hold higher-than-normal stocks of both crude oil and refined products because of increased concern over temporary losses of non-OPEC crude oil supplies and refinery capacity. particular, it is assumed that refiners will hold high levels of stocks during the spring and summer of 1990 because of fears that the extensive maintenance shutdowns in the United Kingdom sector of the North Sea, planned for July through October, may last longer and result in larger losses of production than current plans would indicate.

Alternative Cases

Low Demand

In the low oil price scenario, the world oil price decreases to \$16.00 per barrel in the second quarter of 1990 and remains at that level throughout the forecast period. In this scenario, it is assumed that some OPEC member countries, including Kuwait and the United Arab Emirates, will continue to exceed their production quotas, leading to higher OPEC oil production than in the base scenario. In addition, it is assumed that an even less robust picture emerges for economic growth than in the base case, lowering the growth rate of oil consumption in both the OECD countries and in the Other Market Economies. Finally, it is assumed that oil supplies from non-OPEC producers, including net oil exports from the Centrally Planned Economies (CPE) to the Market Economies, will exceed the rates expected in the base scenario.

High Demand

In the high oil price scenario, the world oil price increases to \$22.00 per barrel in the second quarter of 1990 and remains at that level throughout the forecast period. In this scenario, it is assumed that economic growth will be higher than in the base scenario, leading to significantly higher growth in oil consumption. At the same time, it is assumed that oil production from the United Kingdom and the United States and net oil exports from the CPE to the Market Economies will fall below the rates expected in the base scenario. Finally, it is assumed that the OPEC member nations will agree in June 1990 to increase their minimum reference price and will defend that price by restricting their oil production when necessary.

For more detailed information on the forecast, please refer to the published report, April 1990 Short-Term Energy Outlook. Copies of the report are available from:

National Energy Information Center Room 1F-048, Forrestal Building 1000 Independence Avenue, S.W. Washington, DC 20585 Telephone (202) 586-8800

Calculation of World Oil Price

The weighted average international price of oil, shown in the "Highlights" on page 1 and on page 18, is an average calculated using specific crude oil prices weighted by the estimated crude oil export volume for each oil-producing country. To develop the table shown on page 18, a list of major oil producing/exporting countries was chosen. For each country, the contract selling price of one or more representative crude oils was determined by investigating a number of industry sublications (i.e., "Oil Buyers' Guide", "Platt's Oilgram Price (Report", "Petroleum Intelligence Weekly", and "Weekly Petroleum Argus") and by contacting oil market analysts.

Then, the appropriate crude oil volumes to be used as weighting factors for each country were determined. These volumes are estimates based on a number of sources which provide data on production, consumption, and exports for these countries. Export volumes for a number of smaller producing/exporting countries, not listed in the table, are included in the weighting factors. After the export volumes had been determined, simple

mathematical weighted averages were calculated to arrive at the "Total OPEC," "Total Non-OPEC," and "Total World" prices.

The average United States (FOB) import price is derived by the same basic procedure as the world oil price, that is, taking the representative contract crude oil price of a specific crude oil from a particular country and weighting this price by a certain volume of crude oil. In this case, the weighting factors are the volumes of crude oil imported into the U.S. from pertinent countries. Import volumes from a number of smaller producing/exporting countries, not listed in the table, are included in the weighting factors.

Both the import and export volumes are preliminary. Due to their origin, these estimates cannot be fully verified. These volumes are updated monthly, or more frequently when changes in oil market conditions make updating appropriate.

Explanation and Coverage of Spot Market Product Prices

Definition of spot market product prices for the Rotterdam market: Represent the mid point of the bid/asked price range for CIF cargoes scheduled for prompt arrival at Rotterdam (within 48 hours).

Definition of spot market product prices for the New York market: Represent last sale price reported or offered. Prices are ex-duty and do not include Federal or State taxes.

General definition of spot prices: A transaction concluded "on the spot," that is, on a one-time prompt delivery basis, usually referring to a transaction involving only one cargo of product. This contrasts with a term contract sale which obligates the seller to furnish product on an evenly-spread delivery basis over an extended period of time, usually for 1 year.

Coverage of petroleum product prices is restricted to and updated according to the major products traded. Major products are determined by the highest number of transactions and the highest volumes of product traded, e.g., 1987 replacement of the New York leaded regular gasoline series with the unleaded regular gasoline series.

Glossary

Barrel. A volumetric unit of measure for crude oil and petroleum products equivalent to 42 U.S. gallons.

CIF (Cost, Insurance, Freight). This term refers to a type of sale in which the buyer of the product agrees to pay a unit price that includes the f.o.b. value of the product at the point of origin plus all costs of insurance and transportation. This type of a transaction differs from a "Delivered" purchase, in that the buyer accepts the quantity as determined at the loading port (as certified by the Bill of Lading and Quality Report) rather than pay based on the quantity and quality ascertained at the unloading port. It is similar to the terms of an f.o.b. sale, except that the seller, as a service for which he is compensated, arranges for transportation and insurance.

Cooling Degree-Days. The number of degrees per day the daily average temperature is above 65 degrees F. The daily average temperature is the mean of the maximum and minimum temperature for a 24-hour period.

Crude Oil. A mixture of hydrocarbons that exists in liquid phase in underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Lease condensate and drips are included but topped crude oil (residual) and other unfinished oils are excluded.

Crude Oil Input. The total crude oil put into processing units at refineries.

Degree-Day Normals. Simple arithmetic averages of monthly r annual degree-days over a long period of time (usually the 30-year period 1951-1980). These may be simple degree-day normals or population-weighted degree-day normals.

Distillate Fuel Oil. Includes No. 1, No. 2, and No. 4 fuel oils, and No. 1, No. 2, and No. 4 diesel fuels. These are light fuel oils used primarily for home heating, as a diesel engine fuel (including railroad engine fuel and fuel for agricultural machinery), and for electric power generation.

FOB (Free On Board). Pertains to a transaction whereby the seller makes the product available within an agreed on period at a given port at a given price; it is the responsibility of the buyer to arrange for the transportation and insurance.

Gas Oil. European designation for No. 2 heating oil, and diesel fuel.

Gross Inputs. The crude oil, unfinished oils, and natural gas plant liquids put into atmospheric crude oil distillation units.

Heating Degree-Days. The number of degrees per day the daily average temperature is below 65 degrees F. The daily average temperature is the mean of the maximum and minimum temperature for a 24-hour period.

Imports. Unless otherwise specified in this report, refers to gross imports. Imports of minor products ("other oils") include aviation gasoline, kerosene, unfinished oils, liquefied petroleum gases, plant condensate, petrochemical feedstocks, lube oils, waxes, special naphthas, coke, asphalt, and other miscellaneous oils.

Jet Fuel. Includes kerosene-type jet fuel and naphtha-type jet fuel. Kerosene-type jet fuel is a kerosene quality product used primarily for commerical turbojet and turboprop aircraft engines. Naphtha-type jet fuel is a product in the heavy naphthas range used primarily for military turbojet and turboprop aircraft engines.

Liquefied Refinery Gases (LRG). Liquefied petroleum gases fractionated from refinery or still gases. Through compression and/or refrigeration, they are retained in the liquid state. The reported categories are ethane/ethylene, propane/propylene, normal butane/butylene, and isobutane. Excludes still gas.

Motor Gasoline. Finished leaded gasoline, finished unleaded gasoline, and blending components in the gasoline range. Production data represent finished leaded gasoline and finished unleaded gasoline. Stocks and imports data consist of the two types of finished gasoline and blending components. Stock change used in the calculation of motor gasoline product supplied is the change in finished motor gasoline stocks.

Operable Capacity. The maximum amount of input that can be processed by a crude oil distillation unit in a 24-hour period, making allowances for processing limitations due to types and grades of inputs, limitations of downstream facilities, scheduled and unscheduled downtimes, and environmental constraints. Includes any shutdown capacity that could be placed in operation within 90 days.

Petroleum Administration for Defense Districts (PADD). Five geographical areas into which the nation was divided by the Petroleum Administration for Defense for purposes of administration. These PADDs include the States listed below:

PADD I: Connecticut, Delaware, District of Columbia, Florida, Georgia, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, North Carolina, Pennsylvania, Rhode Island, South Carolina, Vermont, Virginia, and West Virginia.

PADD II: Illinois, Indiana, Iowa, Kansas, Kentucky,
Michigan, Minnesota, Missouri, Nebraska,
North Dakota, Ohio, Oklahoma, South Dakota,
Tennessee, and Wisconsin.

PADD III: Alabama, Arkansas, Louisiana, Mississippi, New Mexico, and Texas.

PADD IV: Colorado, Idaho, Montana, Utah, and Wyoming.

PADD V: Alaska, Arizona, California, Hawaii, Nevada, Oregon, Washington.

Population-Weighted Degree-Days. Heating or cooling degree-days weighted by the population of the area in which the degree-days are recorded. To compute national population-weighted degree-days, the Nation is divided into nine Census regions comprised of from three to eight States which are assigned weights based on the ratio of the population of the region to the total population of the Nation. Degree-day readings for each region are multiplied by the corresponding population weight for each region and these products are then summed to arrive at the national population weighted degree-day figure.

Processing Gain. The volumetric amount by which total output is greater than input for a given period of time. This difference is due to the processing of crude oil into products which, in total, have a lower specific gravity than the crude oil processed.

Products Supplied. A value calculated for specific products which is equal to domestic production plus net imports (imports less exports), less the net increase in primary stocks. Total products supplied is calculated as inputs to refineries, plus estimated refinery gains, plus other hydrocarbon input, plus product imports, less product exports, less the net increase in product stocks. Values shown for "Other Oils" product supplied are the difference between total product supplied and product supplied values for specified products. Other oils product supplied incorporates crude oil product supplied and reclassified product adjustment.

Refiner Acquisition Cost of Crude Oil. The average price paid by refiners for crude oil booked into their refineries in accordance with accounting procedures generally accepted and consistently and historically applied by the refiners concerned. Domestic crude oil is that oil produced in the United States or from the outer continental shelf as defined in 43 USC 1131. Imported crude oil is any crude oil which is not domestic oil. The composite is the weighted average price of domestic and imported crude oil. Prices do not include the price of crude oil for the SPR.

Refinery Capacity Utilization. Ratio of the total amount of crude oil, unfinished oils, and natural gas plant liquids run through crude oil distillation units to the operable capacity of these units. In the period 1979-1984 the refinery capacity utilization for all U.S. refineries ranged between 87 percent and 65 percent. The ratio for an individual refinery may fluctuate much more depending on the type of crude and other raw materials processed, the types of products produced, and the operating conditions of the refinery.

el Oil. Includes No. 5 and No. 6 fuel oils which are used primarily for electric power generation, for i commercial space heating, as a ship fuel, and for strial uses.

r Gasoline Prices. Motor gasoline prices calculated by the Bureau of Labor Statistics (BLS) in conjunction with the construction of the Consumer Price Index (CPI). These prices are collected in 85 urban areas selected to represent all urban consumers -- about 80 percent of the total U.S. population. The service stations are selected initially, and on a replacement basis, in such a way that they represent the purchasing habits of the CPI population. Service stations in the current sample include those providing all types of service (i.e., full-, mini-, and self-service).

Stock Change (Refined Products). Component of Product Supplied calculation shown on U.S. Petroleum Balance, The product stock change shown on the U.S. Petroleum Balance Sheet for the current 4-week period is calculated in the following way; an average daily stock change is calculated for major refined products (i.e., all actual reported stocks); this stock change is added to an estimate for minor product stock change based on historical monthly data; a daily average stock change for refined product stocks for the 4-week period is then calculated. To calculate minor product stock change, the stock levels shown for other oils in the stock section of the balance sheet are used. These other oils stock levels are derived by: 1) computing an average daily rate of stock change for each month based on monthly data for the past 6 years; 2) using this daily rate and the minor stock levels from the most recent monthly publication to estimate the minor product stock level for the current period.

Stocks. For individual products in the WPSR, quantities held at refineries, in pipelines, and at bulk terminals which have a capacity of 50,000 barrels or more, and in transit thereto. Stocks held by product retailers and resellers, as well as tertiary stocks held at the point of consumption, are excluded. Stocks of individual products held at gas processing plants are excluded from individual product estimates but included in "Other Oils" estimates and "Total."

Unaccounted-for Crude Oil. A term which appears in U.S. Petroleum Balance Sheet. It reconciles the difference between data (or estimates) about supply and data (or estimates) about disposition. Its value can be positive or negative since it is a balancing term. As it appears in the monthly publications, it reflects the accuracy of the reported data. Because the unaccounted-for crude oil figure reflects the accuracy of reported and estimated figures, one would expect the figure to be larger in balances using preliminary or estimated data and smaller in balances using final data. In fact, the published figures confirm this expectation. In the WPSR, 4-week averages for the previous year are interpolated from final monthly data, so that the unaccounted-for crude oil value for the previous year is considerably smaller than that for the current period.

United States. For the purpose of the report, the 50 States and the District of Columbia. Data for the Virgin Islands, Puerto Rico, and other U.S. territories are not included in the U.S. Totals.

Energy Information Administration Electronic Publication System (EPUB) User Instructions

Selected Weekly Petroleum Status Report (WPSR), Petroleum Supply Monthly (PSM), Petroleum Marketing Monthly (PMM), Weekly Coal Production (WCP), Electric Power Monthly (EPM), Natural Gas Monthly (NGM), Quarterly Coal Report (QCR), and Short-Term Energy Outlook (STEO) statistics are now available electronically on the Energy Information Administration (EIA) Computer Facility. Public access to these machine readable statistics is possible by dialing (202) 586-8658 for 300 - 2400 baud line speeds. Communications are Asynchronous and require a standard ASCII-type terminal. There is no charge for this service. Although no password is required, you will be requested to use your telephone number as a user identifier. This service is available 7 days per week (8:00 a.m. - 11:00 p.m., Monday thru Friday, and 10:00 a.m. - 6:00 p.m., weekends and holidays).

PLEASE ENTER THE DESIRED REPORT ID... WPSR

4) ENTER YOUR 10 DIGIT PHONE NUMBER

\$WP1081 LOGON IN PROGRESS AT 13:23:22 ON JANUARY 12, 1989 PLEASE ENTER YOUR PHONE NUMBER...

5) YOU WILL THEN SEE A BANNER WHICH SHOWS THE REPORT YOU HAVE SELECTED AND PAUSES TO ALLOW AMPLE TIME TO GET READY TO RECEIVE OUTPUT

YOU HAVE SELECTED WEEKLY STATISTICS FROM THE WEEKLY PETROLEUM REPORTING SYSTEM. THIS SYSTEM WILL DISPLAY THE LATEST U.S. PETROLEUM BALANCE SHEET AND THE MOST RECENT 5 WEEKS OF WEEKLY PETROLEUM STATUS REPORT DATA. PLEASE TURN ON YOUR PRINTER NOW IF YOU WISH TO OBTAIN HARD COPY OUTPUT.

(PRINTING WILL BEGIN IN 20 SECONDS)

Note: Users who experience problems when first attempting to logon should check their terminal switch settings for the following:

- 7 Data Bits
- 1 Stop Bit
- Even Parity

If you are unable to complete logon, dial (202) 586-8959 for assistance.

Action Required to Stay on EIA Mailing List

Did you return your Energy Information Administration (EIA) 1990 Publications Subscription Renewal Notice? It must be signed and returned by July 31, 1990. If not, your name will be removed from the EIA publications mailing list and you will no longer receive EIA publications free of charge.

If you did not receive a Renewal Notice and wish to remain on the mailing list, please call the National Energy Information Center at (202) 586-8800.

Note: This review does not apply to paid subscription lists maintained by the U. S. Government Printing Office.
